Linear Unit QME-WIL

With handwheel locking and position indicator.

QME is a ready to mount positioning table guided with linear ball bearings on hardened shafts and driven by ball- or lead screw. QME can be manually driven by handwheel using either ball screw or lead screw. For drive by motor, the ball screw versions are strongly recommended for sustained performance and precision.

Rollco recommend locking device for all hand driven units with ball screw to avoid back driving. Locking device is always included if position indicator is selected.

The position indicator has 4 digits where the three black-background digits represent position in millimetre and the red-backgrounds digit 1/10 of a millimetre.

Customized machining of the drive- and mounting interfaces, higher level of corrosion resistance or low/high temperature versions, please contact Rollco.

Bellow for Linear Unit QME is recommended for all applications where the unit isn’t protected against dust and dirt. The bellow may also work as a pinch protection.

All dimensions in mm.

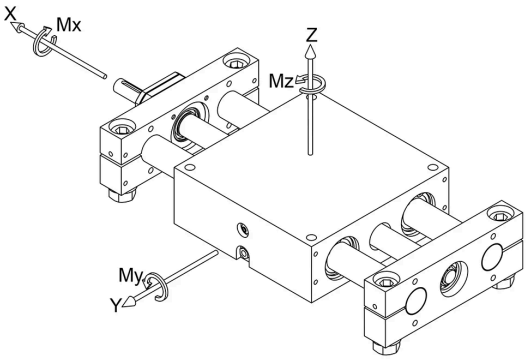

QME12-WIL: Max. L tot: 1 000 mm
QME20-WIL: Max. L tot: 1 500 mm
QME30-WIL: Max. L tot: 2 000 mm

General Data

Permissible load Fz and Fy

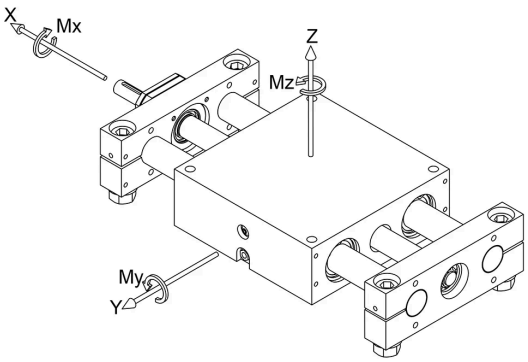

Permissible load based on a shaft deflection of 1/1000 of Ltot. For long units, actual load may need to be reduced to achive a deflection acceptable for the application.

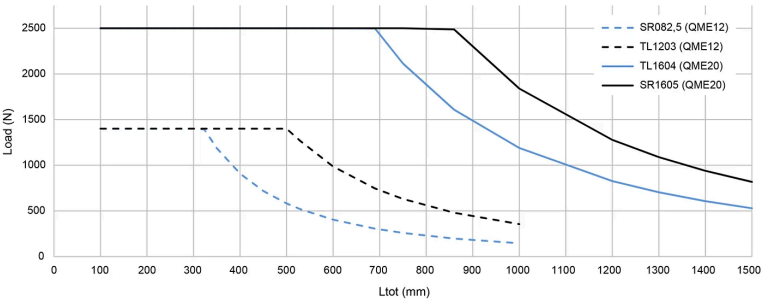

All capacity values are based on the individual ratings of the linear ball bearings used inside the QME and are without any safety factor. The usable load level depends on required service life and the system configuration. The safety factor depends on the application and its requested safety. We recommend a minimum dynamic safety factor 5.

Permissible load Fx

Permissible load is based on the buckling limit of the drive screw.
For QME30, buckling will never occur due to the use of oversized drive screws.

All capacity values are based on the individual ratings of the linear ball bearings used inside the QME and are without any safety factor. The usable load level depends on required service life and the system configuration. The safety factor depends on the application and its requested safety. We recommend a minimum dynamic safety factor 5.

Stroke definition

Working stroke: Is the working stroke of the application.
Absolute stroke: Is defined as Working stroke + Stroke reserve.
Stroke reserve: Is a safety distance to the mechanical end positions.

	Max. Ltot	Max. absolute stroke	
		no bellow	with bellow
QME12	1 000 mm	902 mm	693 mm
QME20	1 500 mm	1 350 mm	1 084 mm
